Multifamily Affordability Estimator (MAE) v3.7

Frequently Asked Questions

This document highlights frequently asked questions about the Multifamily Affordability Estimator process and serves as a quick user reference guide.

1. What is the Multifamily Affordability Estimator?

The Multifamily Affordability Estimator (MAE) is a tool to provide Fannie Mae and Lenders with information on the affordability profile of prospective transactions. This tool leverages published Census Tract affordability data and Lender submitted information on the property location and rents to estimate the affordability profile and FHFA Scorecard Cap Exclusions for a prospective transaction.

2. What is new in the Multifamily Affordability Estimator v3.7?

V3.7 incorporates the 2018 FHFA Scorecard Cap Exclusion guidance. For 2018, FHFA has defined new “Extremely High Cost” markets. Cap exclusions in “Extremely High Cost” markets are available for units affordable at or below 120% AMI. For a list of all market cost designations and more information, please refer to the Fannie Mae Guide for Estimating Affordability and Cap Exclusions.

V3.7 also increases the individual unit record capacity from 570 units to 1,200 individual unit records.

3. Why are standard utility allowances automatically added to rents in the Multifamily Affordability Estimator?

Over 90% of Fannie Mae Multifamily loans do not include utility payments in rents. In order to calculate affordability, FHFA requires that the standard utility allowance be added to unit rents where utility payments are not included. FHFA provides Fannie Mae with the standard utility allowance amounts. Current FHFA Standard Utility Allowances are:

<table>
<thead>
<tr>
<th>Utility Allowances</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 Bedroom Unit (Efficiency/Studio)</td>
<td>$50.00</td>
</tr>
<tr>
<td>1 Bedroom Unit</td>
<td>$77.00</td>
</tr>
<tr>
<td>2 Bedroom Unit</td>
<td>$110.00</td>
</tr>
<tr>
<td>3+ Bedroom Unit</td>
<td>$149.00</td>
</tr>
</tbody>
</table>

4. How are affordability/FHFA Scorecard Cap Exclusions estimated in the Multifamily Affordability Estimator?
The MAE’s estimations are based on a prescribed FHFA formula for determining the affordability of units based on the geographic location of the property as well as the rent and unit mix within the property. The MAE then converts the affordability information into the percentage of the loan that is excluded from the FHFA Scorecard Cap. Various measures of “affordability” can be found as they relate to the multifamily market. However, Fannie Mae is required to apply this prescribed FHFA formula to its loans. Differences in MAE affordability results and other industry affordability measures may be caused by several factors including, but not limited to, affordability formula used, application of affordability formula, precision of geographic level used, accuracy of property location, accuracy of unit and rent data used, and/or vintage of reference data used.

The MAE’s Scorecard Cap Exclusion estimates are rooted in the affordability scores for properties. However, based on FHFA guidance, certain markets and segment types are excluded from the Scorecard Cap at different rates. The MAE takes into account this guidance and provides these estimates.

Here is an example of how percentage of affordability is calculated per FHFA’s formula:

\[
\frac{\text{Annualized Rent + Utilities}}{\text{AMI} \times \text{Bedroom Factor}} = \text{Unit Percent Affordability}
\]

5. **How Are “Rural” Areas Defined?**

Rural areas are defined by the FHFA Duty to Serve rule. The rule defines a “rural” area as:

- A census tract outside of an MSA as designated by the Office of Management and Budget (OMB); or
- A census tract that is in an MSA as designated by OMB but outside of the MSA’s Urbanized Areas as designated by the U.S. Department of Agriculture’s (USDA) Rural-Urban Commuting Area (RUCA) Code #1, and outside of tracts with a housing density of over 64 housing units per square mile for USDA’s RUCA Code #2.

Users are not required to provide any additional information in order to determine a property’s “rural” designation because the census tracts entered (as in prior versions of the MAE) are used to make the “rural” determination. The Multifamily Affordability Estimator will automatically account for “rural” designation in determining Scorecard Cap Exclusion rates.

6. **Why is Fannie Mae Requiring this Additional Information?**

The Multifamily Affordability Estimator will provide Fannie Mae and Lenders with information needed to evaluate the affordability profile and related exclusion from the Scorecard Cap for prospective loan deliveries. The vast majority of Fannie Mae’s multifamily financing currently supports rental housing that is affordable to households earning at their area’s median income level.

7. **Are Lenders required to submit the Multifamily Affordability Estimator with each submission?**

Lenders are required to enter the Multifamily Affordability Estimator results in the appropriate fields within DUS Gateway™ for the following property/segment types:

- Conventional Multifamily;
- Small Multifamily Properties (5-50 Units);
• Targeted Affordable Housing;
• Dedicated Student Housing;
• Cooperative Properties; and
• Seniors Housing (Sr. MAE use required).

All completed MAE files must be emailed to:

multifamily_affordability_estimator@fanniemae.com.

8. How should Lenders complete and submit the Multifamily Affordability Estimator?

Lenders should return to Fannie Mae a completed and saved affordability estimate file for each individual subject property.

Lenders need three types of information for each property in order to run the estimate:

• property/segment type;
• property address (census tract); and
• bedroom type by rent unit counts (rent roll).

Lenders will complete four steps in order to review the results returned in Step 5.

a. Tips on Step 1 - Enter Property Location Information

Lenders will fill out the gray areas with property information including the subject property’s type/segment and physical census tract. Lenders may use the link provided to find the census tract:

The link will take the Lender to the Fannie Mae Property GeoCoder. Users are required to register with the Property GeoCoder one time. Lenders will submit the property street address, city, state, and zip code. The GeoCoder results will provide the census tract. Lenders should then “copy” and “paste special” as “unformatted text” the full 11-digit census tract from the GeoCoder into the appropriate cell in the estimator. Note: some census tracts begin with a zero. Make sure you enter the leading zero:
b. **Tips on Step 2 - Review Results Based on Entered Information**

Once the appropriate, valid 11-digit census tract is entered in Step 1, MSA and Income results will display in Step 2 based on the census tract entered.

c. **Tips on Step 3 - Enter Detailed Rent and Bedroom Type Data**

Lenders should enter the rent roll for the subject property. The estimator provides the ability to submit a summarized version of the rent roll or a detailed unit-by-unit rent roll. If the Lender wishes to enter detailed rent roll data (in excess of 20 bed/rent combinations) the “+” sign in the margin between row 68 and 1249 will expand the section to allow for as many as 1,200 bedroom/rent combinations.

In Column A, Lenders should select the bedroom type information from the drop down menu in each bedroom type cell. Note: if entering multiple bedroom types, the Lender may “copy” and “paste special” as “unformatted text” from previously selected drop down items. The format used in Column A must be exactly as available in the drop down menu.

In Column B, Lenders should enter the respective rent per month for the bedroom type in Column A. Note: if you have the rent data in another spreadsheet, you may “copy” and “paste special” as “unformatted text” into Column B. Keep in mind that MAE automatically includes standard utility allowances in rents based on bedroom type entered so you do not need to add a separate utility allowance.
In Column C, Lenders should enter the number of units associated with the bedroom type and rent entered in Columns A and B. For example, if you have detailed, unit-by-unit rent roll data, Column C should be filled with “1”.

d. Tips on Step 4 - Review Entered Property Detail Data and Warnings

If the number of units entered by the Lender in Step 1 does not match the sum of units entered in Step 3, a warning message will be provided. Other bedroom type/rent information is returned for review.

e. Tips on Step 5 - Results - Use "Save As..." to save your file

Step 5 returns the results based on all entered data. The green area (5.A) contains the estimated percent of units qualifying at <=80%, <=50%, and for Scorecard Cap Exclusions. 5.B provides estimates at various affordability and cap exclusion levels. 5.C and 5.D provide maximum rents at various bedroom type and % AMI levels. If no units entered qualify for affordability measures, a notice will be displayed to the right of the green area indicating such.
